The mac80211 subsystem for kernel developers

Johannes Berg

johannes@sipsolutions.net

The mac80211 subsystem for kernel developers

by Johannes Berg

Copyright © 2007, 2008 Johannes Berg

mac80211 is the Linux stack for 802.11 hardware that implements only partial functionality in hard- or firmware. This document defines the interface between mac80211 and low-level hardware drivers.

If you're reading this document and not the header file itself, it will be incomplete because not all documentation has been converted yet.

Table of Contents

I. The basic mac80211 driver interface

Table of Contents

You should read and understand the information contained within this part of the book while implementing a driver. In some chapters, advanced usage is noted, that may be skipped at first.

This part of the book only covers station and monitor mode functionality, additional information required to implement the other modes is covered in the second part of the book.

Chapter 1. Basic hardware handling

TBD

This chapter shall contain information on getting a hw struct allocated and registered with mac80211.

Since it is required to allocate rates/modes before registering a hw struct, this chapter shall also contain information on setting up the rate/mode structs.

Additionally, some discussion about the callbacks and the general programming model should be in here, including the definition of ieee80211_ops which will be referred to a lot.

Finally, a discussion of hardware capabilities should be done with references to other parts of the book.

struct ieee80211_hw

Name

`struct ieee80211_hw` — hardware information and state

Synopsis

```
struct ieee80211_hw {
  struct ieee80211_conf conf;
  struct wiphy * wiphy;
  struct workqueue_struct * workqueue;
  const char * rate_control_algorithm;
  void * priv;
  u32 flags;
  unsigned int extra_tx_headroom;
  int channel_change_time;
  int vif_data_size;
  u16 queues;
  u16 ampdu_queues;
  u16 max_listen_interval;
  s8 max_signal;
};
```

Members

conf

> struct ieee80211_conf, device configuration, don't use.

wiphy

> This points to the struct wiphy allocated for this 802.11 PHY. You must fill in the *perm_addr* and *dev* members of this structure using SET_IEEE80211_DEV and SET_IEEE80211_PERM_ADDR. Additionally, all supported bands (with channels, bitrates) are registered here.

workqueue

> single threaded workqueue available for driver use, allocated by mac80211 on registration and flushed when an interface is removed.

rate_control_algorithm

> rate control algorithm for this hardware. If unset (NULL), the default algorithm will be used. Must be set before calling ieee80211_register_hw.

priv

> pointer to private area that was allocated for driver use along with this structure.

flags

> hardware flags, see enum ieee80211_hw_flags.

extra_tx_headroom

> headroom to reserve in each transmit skb for use by the driver (e.g. for transmit headers.)

channel_change_time

> time (in microseconds) it takes to change channels.

vif_data_size

> size (in bytes) of the drv_priv data area within struct ieee80211_vif.

queues

> number of available hardware transmit queues for data packets. WMM/QoS requires at least four, these queues need to have configurable access parameters.

ampdu_queues

> number of available hardware transmit queues for A-MPDU packets, these have no access parameters because they're used only for A-MPDU frames. Note that mac80211 will not currently use any of the regular queues for aggregation.

max_listen_interval

> max listen interval in units of beacon interval that HW supports

max_signal

> Maximum value for signal (rssi) in RX information, used only when *IEEE80211_HW_SIGNAL_UNSPEC* or *IEEE80211_HW_SIGNAL_DB*

Description

This structure contains the configuration and hardware information for an 802.11 PHY.

NOTICE

All work performed on this workqueue should NEVER acquire the RTNL lock (i.e. Don't use the function `ieee80211_iterate_active_interfaces`)

enum ieee80211_hw_flags

LINUX

Kernel Hackers ManualJanuary 2010

Name

`enum ieee80211_hw_flags` — hardware flags

Synopsis

```
enum ieee80211_hw_flags {
    IEEE80211_HW_RX_INCLUDES_FCS,
    IEEE80211_HW_HOST_BROADCAST_PS_BUFFERING,
    IEEE80211_HW_2GHZ_SHORT_SLOT_INCAPABLE,
    IEEE80211_HW_2GHZ_SHORT_PREAMBLE_INCAPABLE,
    IEEE80211_HW_SIGNAL_UNSPEC,
    IEEE80211_HW_SIGNAL_DB,
    IEEE80211_HW_SIGNAL_DBM,
    IEEE80211_HW_NOISE_DBM,
    IEEE80211_HW_SPECTRUM_MGMT
};
```

Constants

IEEE80211_HW_RX_INCLUDES_FCS

>   Indicates that received frames passed to the stack include the FCS at the end.

IEEE80211_HW_HOST_BROADCAST_PS_BUFFERING

>   Some wireless LAN chipsets buffer broadcast/multicast frames for power
>   saving stations in the hardware/firmware and others rely on the host system for
>   such buffering. This option is used to configure the IEEE 802.11 upper layer to
>   buffer broadcast and multicast frames when there are power saving stations so
>   that the driver can fetch them with `ieee80211_get_buffered_bc`.

IEEE80211_HW_2GHZ_SHORT_SLOT_INCAPABLE

>   Hardware is not capable of short slot operation on the 2.4 GHz band.

IEEE80211_HW_2GHZ_SHORT_PREAMBLE_INCAPABLE

>   Hardware is not capable of receiving frames with short preamble on the 2.4
>   GHz band.

IEEE80211_HW_SIGNAL_UNSPEC

>   Hardware can provide signal values but we don't know its units. We expect
>   values between 0 and `max_signal`. If possible please provide dB or dBm
>   instead.

IEEE80211_HW_SIGNAL_DB

>   Hardware gives signal values in dB, decibel difference from an arbitrary, fixed
>   reference. We expect values between 0 and `max_signal`. If possible please

provide dBm instead.

IEEE80211_HW_SIGNAL_DBM

Hardware gives signal values in dBm, decibel difference from one milliwatt. This is the preferred method since it is standardized between different devices. `max_signal` does not need to be set.

IEEE80211_HW_NOISE_DBM

Hardware can provide noise (radio interference) values in units dBm, decibel difference from one milliwatt.

IEEE80211_HW_SPECTRUM_MGMT

Hardware supports spectrum management defined in 802.11h Measurement, Channel Switch, Quieting, TPC

Description

These flags are used to indicate hardware capabilities to the stack. Generally, flags here should have their meaning done in a way that the simplest hardware doesn't need setting any particular flags. There are some exceptions to this rule, however, so you are advised to review these flags carefully.

SET_IEEE80211_DEV

LINUX

Kernel Hackers ManualJanuary 2010

Name

`SET_IEEE80211_DEV` — set device for 802.11 hardware

Synopsis

```
void SET_IEEE80211_DEV (struct ieee80211_hw * hw, struct
device * dev);
```

Arguments

hw

> the struct ieee80211_hw to set the device for

dev

> the struct device of this 802.11 device

SET_IEEE80211_PERM_ADDR

LINUX

Kernel Hackers ManualJanuary 2010

Name

SET_IEEE80211_PERM_ADDR — set the permanenet MAC address for 802.11
hardware

Synopsis

```
void SET_IEEE80211_PERM_ADDR (struct ieee80211_hw * hw, u8 *
addr);
```

Arguments

hw

> the struct ieee80211_hw to set the MAC address for

addr

> the address to set

struct ieee80211_ops

Name

`struct ieee80211_ops` — callbacks from mac80211 to the driver

Synopsis

```
struct ieee80211_ops {
  int (* tx) (struct ieee80211_hw *hw, struct sk_buff *skb);
  int (* start) (struct ieee80211_hw *hw);
  void (* stop) (struct ieee80211_hw *hw);
  int (* add_interface) (struct ieee80211_hw *hw,struct ieee80211_if_init_
  void (* remove_interface) (struct ieee80211_hw *hw,struct ieee80211_if_:
  int (* config) (struct ieee80211_hw *hw, struct ieee80211_conf *conf);
  int (* config_interface) (struct ieee80211_hw *hw,struct ieee80211_vif *
  void (* bss_info_changed) (struct ieee80211_hw *hw,struct ieee80211_vif
  void (* configure_filter) (struct ieee80211_hw *hw,unsigned int changed_
  int (* set_tim) (struct ieee80211_hw *hw, int aid, int set);
  int (* set_key) (struct ieee80211_hw *hw, enum set_key_cmd cmd,const u8
  void (* update_tkip_key) (struct ieee80211_hw *hw,struct ieee80211_key_(
  int (* hw_scan) (struct ieee80211_hw *hw, u8 *ssid, size_t len);
  int (* get_stats) (struct ieee80211_hw *hw,struct ieee80211_low_level_st
  void (* get_tkip_seq) (struct ieee80211_hw *hw, u8 hw_key_idx,u32 *iv32,
  int (* set_rts_threshold) (struct ieee80211_hw *hw, u32 value);
  int (* set_frag_threshold) (struct ieee80211_hw *hw, u32 value);
  int (* set_retry_limit) (struct ieee80211_hw *hw,u32 short_retry, u32 lc
```

```
      void (* sta_notify) (struct ieee80211_hw *hw, struct ieee80211_vif *vif,
      int (* conf_tx) (struct ieee80211_hw *hw, u16 queue,const struct ieee802
      int (* get_tx_stats) (struct ieee80211_hw *hw,struct ieee80211_tx_queue_
      u64 (* get_tsf) (struct ieee80211_hw *hw);
      void (* reset_tsf) (struct ieee80211_hw *hw);
      int (* tx_last_beacon) (struct ieee80211_hw *hw);
      int (* ampdu_action) (struct ieee80211_hw *hw,enum ieee80211_ampdu_mlme_
};
```

Members

tx

> Handler that 802.11 module calls for each transmitted frame. skb contains the
> buffer starting from the IEEE 802.11 header. The low-level driver should send
> the frame out based on configuration in the TX control data. This handler
> should, preferably, never fail and stop queues appropriately, more importantly,
> however, it must never fail for A-MPDU-queues. Must be implemented and
> atomic.

start

> Called before the first netdevice attached to the hardware is enabled. This
> should turn on the hardware and must turn on frame reception (for possibly
> enabled monitor interfaces.) Returns negative error codes, these may be seen in
> userspace, or zero. When the device is started it should not have a MAC
> address to avoid acknowledging frames before a non-monitor device is added.
> Must be implemented.

stop

> Called after last netdevice attached to the hardware is disabled. This should
> turn off the hardware (at least it must turn off frame reception.) May be called
> right after add_interface if that rejects an interface. Must be implemented.

add_interface

> Called when a netdevice attached to the hardware is enabled. Because it is not
> called for monitor mode devices, *open* and *stop* must be implemented. The
> driver should perform any initialization it needs before the device can be
> enabled. The initial configuration for the interface is given in the conf
> parameter. The callback may refuse to add an interface by returning a negative
> error code (which will be seen in userspace.) Must be implemented.

remove_interface

> Notifies a driver that an interface is going down. The `stop` callback is called after this if it is the last interface and no monitor interfaces are present. When all interfaces are removed, the MAC address in the hardware must be cleared so the device no longer acknowledges packets, the mac_addr member of the conf structure is, however, set to the MAC address of the device going away. Hence, this callback must be implemented.

config

> Handler for configuration requests. IEEE 802.11 code calls this function to change hardware configuration, e.g., channel.

config_interface

> Handler for configuration requests related to interfaces (e.g. BSSID changes.)

bss_info_changed

> Handler for configuration requests related to BSS parameters that may vary during BSS's lifespan, and may affect low level driver (e.g. assoc/disassoc status, erp parameters). This function should not be used if no BSS has been set, unless for association indication. The `changed` parameter indicates which of the bss parameters has changed when a call is made.

configure_filter

> Configure the device's RX filter. See the section "Frame filtering" for more information. This callback must be implemented and atomic.

set_tim

> Set TIM bit. mac80211 calls this function when a TIM bit must be set or cleared for a given AID. Must be atomic.

set_key

> See the section "Hardware crypto acceleration" This callback can sleep, and is only called between add_interface and remove_interface calls, i.e. while the interface with the given local_address is enabled.

update_tkip_key

> See the section "Hardware crypto acceleration" This callback will be called in the context of Rx. Called for drivers which set IEEE80211_KEY_FLAG_TKIP_REQ_RX_P1_KEY.

hw_scan

Ask the hardware to service the scan request, no need to start the scan state machine in stack. The scan must honour the channel configuration done by the regulatory agent in the wiphy's registered bands.

get_stats

return low-level statistics

get_tkip_seq

If your device implements TKIP encryption in hardware this callback should be provided to read the TKIP transmit IVs (both IV32 and IV16) for the given key from hardware.

set_rts_threshold

Configuration of RTS threshold (if device needs it)

set_frag_threshold

Configuration of fragmentation threshold. Assign this if the device does fragmentation by itself; if this method is assigned then the stack will not do fragmentation.

set_retry_limit

Configuration of retry limits (if device needs it)

sta_notify

Notifies low level driver about addition or removal of assocaited station or AP.

conf_tx

Configure TX queue parameters (EDCF (aifs, cw_min, cw_max), bursting) for a hardware TX queue. Must be atomic.

get_tx_stats

Get statistics of the current TX queue status. This is used to get number of currently queued packets (queue length), maximum queue size (limit), and total number of packets sent using each TX queue (count). The 'stats' pointer points to an array that has hw->queues + hw->ampdu_queues items.

get_tsf

Get the current TSF timer value from firmware/hardware. Currently, this is only used for IBSS mode debugging and, as such, is not a required function. Must be atomic.

reset_tsf

> Reset the TSF timer and allow firmware/hardware to synchronize with other STAs in the IBSS. This is only used in IBSS mode. This function is optional if the firmware/hardware takes full care of TSF synchronization.

tx_last_beacon

> Determine whether the last IBSS beacon was sent by us. This is needed only for IBSS mode and the result of this function is used to determine whether to reply to Probe Requests.

ampdu_action

> Perform a certain A-MPDU action The RA/TID combination determines the destination and TID we want the ampdu action to be performed for. The action is defined through ieee80211_ampdu_mlme_action. Starting sequence number (ssn) is the first frame we expect to perform the action on. notice that TX/RX_STOP can pass NULL for this parameter.

Description

This structure contains various callbacks that the driver may handle or, in some cases, must handle, for example to configure the hardware to a new channel or to transmit a frame.

ieee80211_alloc_hw

LINUX

Kernel Hackers ManualJanuary 2010

Name

`ieee80211_alloc_hw` — Allocate a new hardware device

Synopsis

```
struct ieee80211_hw * ieee80211_alloc_hw (size_t
priv_data_len, const struct ieee80211_ops * ops);
```

Arguments

`priv_data_len`

length of private data

`ops`

callbacks for this device

Description

This must be called once for each hardware device. The returned pointer must be used to refer to this device when calling other functions. mac80211 allocates a private data area for the driver pointed to by `priv` in struct ieee80211_hw, the size of this area is given as `priv_data_len`.

ieee80211_register_hw

LINUX

Kernel Hackers ManualJanuary 2010

Name

`ieee80211_register_hw` — Register hardware device

Synopsis

```
int ieee80211_register_hw (struct ieee80211_hw * hw);
```

Arguments

hw

> the device to register as returned by `ieee80211_alloc_hw`

Description

You must call this function before any other functions in mac80211. Note that before a hardware can be registered, you need to fill the contained wiphy's information.

ieee80211_get_tx_led_name

LINUX

Kernel Hackers ManualJanuary 2010

Name

`ieee80211_get_tx_led_name` — get name of TX LED

Synopsis

```
char * ieee80211_get_tx_led_name (struct ieee80211_hw * hw);
```

Arguments

hw

> the hardware to get the LED trigger name for

Description

mac80211 creates a transmit LED trigger for each wireless hardware that can be used to drive LEDs if your driver registers a LED device. This function returns the name (or NULL if not configured for LEDs) of the trigger so you can automatically link the LED device.

ieee80211_get_rx_led_name

Name

ieee80211_get_rx_led_name — get name of RX LED

Synopsis

char * **ieee80211_get_rx_led_name** (struct ieee80211_hw * *hw*);

Arguments

hw

> the hardware to get the LED trigger name for

Description

mac80211 creates a receive LED trigger for each wireless hardware that can be used to drive LEDs if your driver registers a LED device. This function returns the name (or `NULL` if not configured for LEDs) of the trigger so you can automatically link the LED device.

ieee80211_get_assoc_led_name

Name

`ieee80211_get_assoc_led_name` — get name of association LED

Synopsis

```
char * ieee80211_get_assoc_led_name (struct ieee80211_hw *
hw);
```

Arguments

hw

the hardware to get the LED trigger name for

Description

mac80211 creates a association LED trigger for each wireless hardware that can be used to drive LEDs if your driver registers a LED device. This function returns the

name (or `NULL` if not configured for LEDs) of the trigger so you can automatically link the LED device.

ieee80211_get_radio_led_name

Name

`ieee80211_get_radio_led_name` — get name of radio LED

Synopsis

```
char * ieee80211_get_radio_led_name (struct ieee80211_hw *
hw);
```

Arguments

hw

the hardware to get the LED trigger name for

Description

mac80211 creates a radio change LED trigger for each wireless hardware that can be used to drive LEDs if your driver registers a LED device. This function returns the name (or `NULL` if not configured for LEDs) of the trigger so you can automatically link the LED device.

ieee80211_unregister_hw

Name

`ieee80211_unregister_hw` — Unregister a hardware device

Synopsis

`void **ieee80211_unregister_hw** (struct ieee80211_hw * *hw*);`

Arguments

hw

    the hardware to unregister

Description

This function instructs mac80211 to free allocated resources and unregister netdevices from the networking subsystem.

ieee80211_free_hw

Name

ieee80211_free_hw — free hardware descriptor

Synopsis

void **ieee80211_free_hw** (struct ieee80211_hw * *hw*);

Arguments

hw

> the hardware to free

Description

This function frees everything that was allocated, including the private data for the driver. You must call ieee80211_unregister_hw before calling this function.

Chapter 2. PHY configuration

TBD

This chapter should describe PHY handling including start/stop callbacks and the various structures used.

struct ieee80211_conf

Name

`struct ieee80211_conf` — configuration of the device

Synopsis

```
struct ieee80211_conf {
  int radio_enabled;
  int beacon_int;
  u16 listen_interval;
  u32 flags;
  int power_level;
  int max_antenna_gain;
  u8 antenna_sel_tx;
  u8 antenna_sel_rx;
  struct ieee80211_channel * channel;
  struct ieee80211_ht_info ht_conf;
  struct ieee80211_ht_bss_info ht_bss_conf;
};
```

Members

radio_enabled

> when zero, driver is required to switch off the radio. TODO make a flag

beacon_int

    beacon interval (TODO make interface config)

listen_interval

    listen interval in units of beacon interval

flags

    configuration flags defined above

power_level

    requested transmit power (in dBm)

max_antenna_gain

    maximum antenna gain (in dBi)

antenna_sel_tx

    transmit antenna selection, 0: default/diversity, 1/2: antenna 0/1

antenna_sel_rx

    receive antenna selection, like `antenna_sel_tx`

channel

    the channel to tune to

ht_conf

    describes current self configuration of 802.11n HT capabilies

ht_bss_conf

    describes current BSS configuration of 802.11n HT parameters

Description

This struct indicates how the driver shall configure the hardware.

enum ieee80211_conf_flags

Name

`enum ieee80211_conf_flags` — configuration flags

Synopsis

```
enum ieee80211_conf_flags {
  IEEE80211_CONF_SHORT_SLOT_TIME,
  IEEE80211_CONF_RADIOTAP,
  IEEE80211_CONF_SUPPORT_HT_MODE,
  IEEE80211_CONF_PS
};
```

Constants

IEEE80211_CONF_SHORT_SLOT_TIME

    use 802.11g short slot time

IEEE80211_CONF_RADIOTAP

    add radiotap header at receive time (if supported)

IEEE80211_CONF_SUPPORT_HT_MODE

    use 802.11n HT capabilities (if supported)

IEEE80211_CONF_PS

    Enable 802.11 power save mode

Description

Flags to define PHY configuration options

Chapter 2. PHY configuration

Chapter 3. Virtual interfaces

TBD

This chapter should describe virtual interface basics that are relevant to the driver (VLANs, MGMT etc are not.) It should explain the use of the add_iface/remove_iface callbacks as well as the interface configuration callbacks.

Things related to AP mode should be discussed there.

Things related to supporting multiple interfaces should be in the appropriate chapter, a BIG FAT note should be here about this though and the recommendation to allow only a single interface in STA mode at first!

enum ieee80211_if_types

LINUX

Kernel Hackers ManualJanuary 2010

Name

enum `ieee80211_if_types` — types of 802.11 network interfaces

Synopsis

```
enum ieee80211_if_types {
  IEEE80211_IF_TYPE_INVALID,
  IEEE80211_IF_TYPE_AP,
  IEEE80211_IF_TYPE_STA,
  IEEE80211_IF_TYPE_IBSS,
  IEEE80211_IF_TYPE_MESH_POINT,
  IEEE80211_IF_TYPE_MNTR,
  IEEE80211_IF_TYPE_WDS,
  IEEE80211_IF_TYPE_VLAN
};
```

Constants

IEEE80211_IF_TYPE_INVALID

invalid interface type, not used by mac80211 itself

IEEE80211_IF_TYPE_AP

interface in AP mode.

IEEE80211_IF_TYPE_STA

interface in STA (client) mode.

IEEE80211_IF_TYPE_IBSS

interface in IBSS (ad-hoc) mode.

IEEE80211_IF_TYPE_MESH_POINT

802.11s mesh point

IEEE80211_IF_TYPE_MNTR

interface in monitor (rfmon) mode.

IEEE80211_IF_TYPE_WDS

interface in WDS mode.

IEEE80211_IF_TYPE_VLAN

VLAN interface bound to an AP, drivers will never see this type.

struct ieee80211_if_init_conf

LINUX

Kernel Hackers ManualJanuary 2010

Name

struct ieee80211_if_init_conf — initial configuration of an interface

Synopsis

```
struct ieee80211_if_init_conf {
  enum ieee80211_if_types type;
  struct ieee80211_vif * vif;
  void * mac_addr;
};
```

Members

type

>   one of enum ieee80211_if_types constants. Determines the type of
>   added/removed interface.

vif

>   pointer to a driver-use per-interface structure. The pointer itself is also used for
>   various functions including `ieee80211_beacon_get` and
>   `ieee80211_get_buffered_bc`.

mac_addr

>   pointer to MAC address of the interface. This pointer is valid until the interface
>   is removed (i.e. it cannot be used after `remove_interface` callback was
>   called for this interface).

Description

This structure is used in `add_interface` and `remove_interface` callbacks of
struct ieee80211_hw.

When you allow multiple interfaces to be added to your PHY, take care that the
hardware can actually handle multiple MAC addresses. However, also take care that
when there's no interface left with mac_addr != `NULL` you remove the MAC address
from the device to avoid acknowledging packets in pure monitor mode.

struct ieee80211_if_conf

Name

`struct ieee80211_if_conf` — configuration of an interface

Synopsis

```
struct ieee80211_if_conf {
  u32 changed;
  u8 * bssid;
  u8 * ssid;
  size_t ssid_len;
};
```

Members

changed

   parameters that have changed, see enum ieee80211_if_conf_change.

bssid

   BSSID of the network we are associated to/creating.

ssid

   used (together with `ssid_len`) by drivers for hardware that generate beacons
   independently. The pointer is valid only during the `config_interface` call,
   so copy the value somewhere if you need it.

ssid_len

   length of the `ssid` field.

Description

This structure is passed to the `config_interface` callback of struct ieee80211_hw.

Chapter 4. Receive and transmit processing

4.1. what should be here

TBD

This should describe the receive and transmit paths in mac80211/the drivers as well as transmit status handling.

4.2. Frame format

As a general rule, when frames are passed between mac80211 and the driver, they start with the IEEE 802.11 header and include the same octets that are sent over the air except for the FCS which should be calculated by the hardware.

There are, however, various exceptions to this rule for advanced features:

The first exception is for hardware encryption and decryption offload where the IV/ICV may or may not be generated in hardware.

Secondly, when the hardware handles fragmentation, the frame handed to the driver from mac80211 is the MSDU, not the MPDU.

Finally, for received frames, the driver is able to indicate that it has filled a radiotap header and put that in front of the frame; if it does not do so then mac80211 may add this under certain circumstances.

4.3. Alignment issues

TBD

4.4. Calling into mac80211 from interrupts

Only `ieee80211_tx_status_irqsafe` and `ieee80211_rx_irqsafe` can be called in hardware interrupt context. The low-level driver must not call any other functions in hardware interrupt context. If there is a need for such call, the low-level

driver should first ACK the interrupt and perform the IEEE 802.11 code call after
this, e.g. from a scheduled workqueue or even tasklet function.

NOTE: If the driver opts to use the `_irqsafe` functions, it may not also use the
non-IRQ-safe functions!

4.5. functions/definitions

struct ieee80211_rx_status

Name

struct ieee80211_rx_status — receive status

Synopsis

```
struct ieee80211_rx_status {
  u64 mactime;
  enum ieee80211_band band;
  int freq;
  int signal;
  int noise;
  int qual;
  int antenna;
  int rate_idx;
  int flag;
};
```

Members

mactime

> value in microseconds of the 64-bit Time Synchronization Function (TSF)
> timer when the first data symbol (MPDU) arrived at the hardware.

band

> the active band when this frame was received

freq

> frequency the radio was tuned to when receiving this frame, in MHz

signal

> signal strength when receiving this frame, either in dBm, in dB or unspecified
> depending on the hardware capabilities flags `IEEE80211_HW_SIGNAL_*`

noise

> noise when receiving this frame, in dBm.

qual

> overall signal quality indication, in percent (0-100).

antenna

> antenna used

rate_idx

> index of data rate into band's supported rates

flag

> `RX_FLAG_*`

Description

The low-level driver should provide this information (the subset supported by
hardware) to the 802.11 code with each received frame.

enum mac80211_rx_flags

LINUX

Name

enum `mac80211_rx_flags` — receive flags

Synopsis

```
enum mac80211_rx_flags {
  RX_FLAG_MMIC_ERROR,
  RX_FLAG_DECRYPTED,
  RX_FLAG_RADIOTAP,
  RX_FLAG_MMIC_STRIPPED,
  RX_FLAG_IV_STRIPPED,
  RX_FLAG_FAILED_FCS_CRC,
  RX_FLAG_FAILED_PLCP_CRC,
  RX_FLAG_TSFT
};
```

Constants

RX_FLAG_MMIC_ERROR

Michael MIC error was reported on this frame. Use together with
`RX_FLAG_MMIC_STRIPPED`.

RX_FLAG_DECRYPTED

This frame was decrypted in hardware.

RX_FLAG_RADIOTAP

This frame starts with a radiotap header.

RX_FLAG_MMIC_STRIPPED

the Michael MIC is stripped off this frame, verification has been done by the
hardware.

RX_FLAG_IV_STRIPPED

The IV/ICV are stripped from this frame. If this flag is set, the stack cannot do
any replay detection hence the driver or hardware will have to do that.

RX_FLAG_FAILED_FCS_CRC

>   Set this flag if the FCS check failed on the frame.

RX_FLAG_FAILED_PLCP_CRC

>   Set this flag if the PCLP check failed on the frame.

RX_FLAG_TSFT

>   The timestamp passed in the RX status (`mactime` field) is valid. This is useful
>   in monitor mode and necessary for beacon frames to enable IBSS merging.

Description

These flags are used with the `flag` member of struct ieee80211_rx_status.

---

ieee80211_rx

LINUX

Kernel Hackers ManualJanuary 2010

Name

ieee80211_rx — receive frame

Synopsis

```
void ieee80211_rx (struct ieee80211_hw * hw, struct sk_buff *
skb, struct ieee80211_rx_status * status);
```

Arguments

hw

> the hardware this frame came in on

skb

> the buffer to receive, owned by mac80211 after this call

status

> status of this frame; the status pointer need not be valid after this function
> returns

Description

Use this function to hand received frames to mac80211. The receive buffer in *skb*
must start with an IEEE 802.11 header or a radiotap header if `RX_FLAG_RADIOTAP`
is set in the *status* flags.

This function may not be called in IRQ context. Calls to this function for a single
hardware must be synchronized against each other. Calls to this function and
`ieee80211_rx_irqsafe` may not be mixed for a single hardware.

ieee80211_rx_irqsafe

LINUX

Name

`ieee80211_rx_irqsafe` — receive frame

Synopsis

```
void ieee80211_rx_irqsafe (struct ieee80211_hw * hw, struct
sk_buff * skb, struct ieee80211_rx_status * status);
```

Arguments

`hw`

 the hardware this frame came in on

`skb`

 the buffer to receive, owned by mac80211 after this call

`status`

 status of this frame; the status pointer need not be valid after this function
 returns and is not freed by mac80211, it is recommended that it points to a
 stack area

Description

Like `ieee80211_rx` but can be called in IRQ context (internally defers to a
tasklet.)

Calls to this function and `ieee80211_rx` may not be mixed for a single hardware.

ieee80211_tx_status

Name

ieee80211_tx_status — transmit status callback

Synopsis

void **ieee80211_tx_status** (struct ieee80211_hw * *hw*, struct sk_buff * *skb*);

Arguments

hw

the hardware the frame was transmitted by

skb

the frame that was transmitted, owned by mac80211 after this call

Description

Call this function for all transmitted frames after they have been transmitted. It is permissible to not call this function for multicast frames but this can affect statistics.

This function may not be called in IRQ context. Calls to this function for a single hardware must be synchronized against each other. Calls to this function and ieee80211_tx_status_irqsafe may not be mixed for a single hardware.

ieee80211_tx_status_irqsafe

Name

`ieee80211_tx_status_irqsafe` — IRQ-safe transmit status callback

Synopsis

```
void ieee80211_tx_status_irqsafe (struct ieee80211_hw * hw,
struct sk_buff * skb);
```

Arguments

hw

> the hardware the frame was transmitted by

skb

> the frame that was transmitted, owned by mac80211 after this call

Description

Like `ieee80211_tx_status` but can be called in IRQ context (internally defers to a tasklet.)

Calls to this function and `ieee80211_tx_status` may not be mixed for a single hardware.

ieee80211_rts_get

Name

`ieee80211_rts_get` — RTS frame generation function

Synopsis

```
void ieee80211_rts_get (struct ieee80211_hw * hw, struct
ieee80211_vif * vif, const void * frame, size_t frame_len,
const struct ieee80211_tx_info * frame_txctl, struct
ieee80211_rts * rts);
```

Arguments

hw

pointer obtained from `ieee80211_alloc_hw`.

vif

struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

frame

pointer to the frame that is going to be protected by the RTS.

frame_len

the frame length (in octets).

frame_txctl

struct ieee80211_tx_info of the frame.

rts

The buffer where to store the RTS frame.

Description

If the RTS frames are generated by the host system (i.e., not in hardware/firmware), the low-level driver uses this function to receive the next RTS frame from the 802.11 code. The low-level is responsible for calling this function before and RTS frame is needed.

ieee80211_rts_duration

LINUX

Kernel Hackers ManualJanuary 2010

Name

`ieee80211_rts_duration` — Get the duration field for an RTS frame

Synopsis

`__le16` **ieee80211_rts_duration** `(struct ieee80211_hw * hw, struct ieee80211_vif * vif, size_t frame_len, const struct ieee80211_tx_info * frame_txctl);`

Arguments

`hw`

> pointer obtained from `ieee80211_alloc_hw`.

`vif`

> struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

`frame_len`

> the length of the frame that is going to be protected by the RTS.

`frame_txctl`

> struct ieee80211_tx_info of the frame.

Description

If the RTS is generated in firmware, but the host system must provide the duration field, the low-level driver uses this function to receive the duration field value in little-endian byteorder.

ieee80211_ctstoself_get

Name

`ieee80211_ctstoself_get` — CTS-to-self frame generation function

Synopsis

```
void ieee80211_ctstoself_get (struct ieee80211_hw * hw, struct
ieee80211_vif * vif, const void * frame, size_t frame_len,
const struct ieee80211_tx_info * frame_txctl, struct
ieee80211_cts * cts);
```

Arguments

`hw`

> pointer obtained from `ieee80211_alloc_hw`.

vif

struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

frame

pointer to the frame that is going to be protected by the CTS-to-self.

frame_len

the frame length (in octets).

frame_txctl

struct ieee80211_tx_info of the frame.

cts

The buffer where to store the CTS-to-self frame.

Description

If the CTS-to-self frames are generated by the host system (i.e., not in hardware/firmware), the low-level driver uses this function to receive the next CTS-to-self frame from the 802.11 code. The low-level is responsible for calling this function before and CTS-to-self frame is needed.

ieee80211_ctstoself_duration

Name

ieee80211_ctstoself_duration — Get the duration field for a CTS-to-self frame

Synopsis

```
__le16 ieee80211_ctstoself_duration (struct ieee80211_hw * hw,
struct ieee80211_vif * vif, size_t frame_len, const struct
ieee80211_tx_info * frame_txctl);
```

Arguments

hw

>   pointer obtained from `ieee80211_alloc_hw`.

vif

>   struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

frame_len

>   the length of the frame that is going to be protected by the CTS-to-self.

frame_txctl

>   struct ieee80211_tx_info of the frame.

Description

If the CTS-to-self is generated in firmware, but the host system must provide the
duration field, the low-level driver uses this function to receive the duration field
value in little-endian byteorder.

ieee80211_generic_frame_duration

LINUX

Name

`ieee80211_generic_frame_duration` — Calculate the duration field for a frame

Synopsis

`__le16` **`ieee80211_generic_frame_duration`** `(struct ieee80211_hw *` `hw, struct ieee80211_vif *` `vif, size_t` `frame_len, struct` `ieee80211_rate *` `rate);`

Arguments

`hw`

    pointer obtained from `ieee80211_alloc_hw`.

`vif`

    struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

`frame_len`

    the length of the frame.

`rate`

    the rate at which the frame is going to be transmitted.

Description

Calculate the duration field of some generic frame, given its length and transmission rate (in 100kbps).

ieee80211_get_hdrlen_from_skb

Name

`ieee80211_get_hdrlen_from_skb` — get header length from data

Synopsis

`unsigned int` **`ieee80211_get_hdrlen_from_skb`** `(const struct sk_buff *` *`skb`*`);`

Arguments

`skb`

> the frame

Description

Given an skb with a raw 802.11 header at the data pointer this function returns the 802.11 header length in bytes (not including encryption headers). If the data in the sk_buff is too short to contain a valid 802.11 header the function returns 0.

ieee80211_get_hdrlen

Name

`ieee80211_get_hdrlen` — get header length from frame control

Synopsis

`int` **`ieee80211_get_hdrlen`** `(u16` *`fc`*`);`

Arguments

`fc`

    the frame control field (in CPU endianness)

Description

This function returns the 802.11 header length in bytes (not including encryption headers.)

ieee80211_wake_queue

LINUX

Name

`ieee80211_wake_queue` — wake specific queue

Synopsis

```
void ieee80211_wake_queue (struct ieee80211_hw * hw, int
queue);
```

Arguments

hw

>   pointer as obtained from `ieee80211_alloc_hw`.

queue

>   queue number (counted from zero).

Description

Drivers should use this function instead of netif_wake_queue.

ieee80211_stop_queue

Name

`ieee80211_stop_queue` — stop specific queue

Synopsis

```
void ieee80211_stop_queue (struct ieee80211_hw * hw, int
queue);
```

Arguments

hw

  pointer as obtained from `ieee80211_alloc_hw`.

queue

  queue number (counted from zero).

Description

Drivers should use this function instead of netif_stop_queue.

/usr/src/packages/BUILD/linux-2.6.27.42-0.1//include/net/mac80211.h

Name

/usr/src/packages/BUILD/linux-2.6.27.42-0.1//include/net/mac80211.
— Document generation inconsistency

Oops

</td></tr>
</table>

ieee80211_stop_queues

Name

ieee80211_stop_queues — stop all queues

Synopsis

void **ieee80211_stop_queues** (struct ieee80211_hw * *hw*);

Arguments

hw

> pointer as obtained from ieee80211_alloc_hw.

Description

Drivers should use this function instead of netif_stop_queue.

ieee80211_wake_queues

Name

`ieee80211_wake_queues` — wake all queues

Synopsis

`void `**`ieee80211_wake_queues`**` (struct ieee80211_hw * hw);`

Arguments

`hw`

> pointer as obtained from `ieee80211_alloc_hw`.

Description

Drivers should use this function instead of netif_wake_queue.

Chapter 5. Frame filtering

mac80211 requires to see many management frames for proper operation, and users may want to see many more frames when in monitor mode. However, for best CPU usage and power consumption, having as few frames as possible percolate through the stack is desirable. Hence, the hardware should filter as much as possible.

To achieve this, mac80211 uses filter flags (see below) to tell the driver's `configure_filter` function which frames should be passed to mac80211 and which should be filtered out.

The `configure_filter` callback is invoked with the parameters `mc_count` and `mc_list` for the combined multicast address list of all virtual interfaces, `changed_flags` telling which flags were changed and `total_flags` with the new flag states.

If your device has no multicast address filters your driver will need to check both the `FIF_ALLMULTI` flag and the `mc_count` parameter to see whether multicast frames should be accepted or dropped.

All unsupported flags in `total_flags` must be cleared. Hardware does not support a flag if it is incapable of _passing_ the frame to the stack. Otherwise the driver must ignore the flag, but not clear it. You must _only_ clear the flag (announce no support for the flag to mac80211) if you are not able to pass the packet type to the stack (so the hardware always filters it). So for example, you should clear `FIF_CONTROL`, if your hardware always filters control frames. If your hardware always passes control frames to the kernel and is incapable of filtering them, you do _not_ clear the `FIF_CONTROL` flag. This rule applies to all other FIF flags as well.

enum ieee80211_filter_flags

Name

`enum ieee80211_filter_flags` — hardware filter flags

Synopsis

`enum ieee80211_filter_flags {`

```
        FIF_PROMISC_IN_BSS,
        FIF_ALLMULTI,
        FIF_FCSFAIL,
        FIF_PLCPFAIL,
        FIF_BCN_PRBRESP_PROMISC,
        FIF_CONTROL,
        FIF_OTHER_BSS
};
```

Constants

FIF_PROMISC_IN_BSS

promiscuous mode within your BSS, think of the BSS as your network segment and then this corresponds to the regular ethernet device promiscuous mode.

FIF_ALLMULTI

pass all multicast frames, this is used if requested by the user or if the hardware is not capable of filtering by multicast address.

FIF_FCSFAIL

pass frames with failed FCS (but you need to set the `RX_FLAG_FAILED_FCS_CRC` for them)

FIF_PLCPFAIL

pass frames with failed PLCP CRC (but you need to set the `RX_FLAG_FAILED_PLCP_CRC` for them

FIF_BCN_PRBRESP_PROMISC

This flag is set during scanning to indicate to the hardware that it should not filter beacons or probe responses by BSSID. Filtering them can greatly reduce the amount of processing mac80211 needs to do and the amount of CPU wakeups, so you should honour this flag if possible.

FIF_CONTROL

pass control frames, if PROMISC_IN_BSS is not set then only those addressed to this station

FIF_OTHER_BSS

pass frames destined to other BSSes

Frame filtering

These flags determine what the filter in hardware should be programmed to let through and what should not be passed to the stack. It is always safe to pass more frames than requested, but this has negative impact on power consumption.

II. Advanced driver interface

Table of Contents

Information contained within this part of the book is of interest only for advanced interaction of mac80211 with drivers to exploit more hardware capabilities and improve performance.

Chapter 6. Hardware crypto acceleration

mac80211 is capable of taking advantage of many hardware acceleration designs for encryption and decryption operations.

The `set_key` callback in the struct ieee80211_ops for a given device is called to enable hardware acceleration of encryption and decryption. The callback takes an *address* parameter that will be the broadcast address for default keys, the other station's hardware address for individual keys or the zero address for keys that will be used only for transmission. Multiple transmission keys with the same key index may be used when VLANs are configured for an access point.

The *local_address* parameter will always be set to our own address, this is only relevant if you support multiple local addresses.

When transmitting, the TX control data will use the *hw_key_idx* selected by the driver by modifying the struct ieee80211_key_conf pointed to by the *key* parameter to the `set_key` function.

The `set_key` call for the `SET_KEY` command should return 0 if the key is now in use, `-EOPNOTSUPP` or `-ENOSPC` if it couldn't be added; if you return 0 then hw_key_idx must be assigned to the hardware key index, you are free to use the full u8 range.

When the cmd is `DISABLE_KEY` then it must succeed.

Note that it is permissible to not decrypt a frame even if a key for it has been uploaded to hardware, the stack will not make any decision based on whether a key has been uploaded or not but rather based on the receive flags.

The struct ieee80211_key_conf structure pointed to by the *key* parameter is guaranteed to be valid until another call to `set_key` removes it, but it can only be used as a cookie to differentiate keys.

In TKIP some HW need to be provided a phase 1 key, for RX decryption acceleration (i.e. iwlwifi). Those drivers should provide update_tkip_key handler. The `update_tkip_key` call updates the driver with the new phase 1 key. This happens everytime the iv16 wraps around (every 65536 packets). The `set_key` call will happen only once for each key (unless the AP did rekeying), it will not include a valid phase 1 key. The valid phase 1 key is provided by udpate_tkip_key only. The trigger that makes mac80211 call this handler is software decryption with wrap around of iv16.

enum set_key_cmd

Name

`enum set_key_cmd` — key command

Synopsis

```
enum set_key_cmd {
  SET_KEY,
  DISABLE_KEY
};
```

Constants

SET_KEY

    a key is set

DISABLE_KEY

    a key must be disabled

Description

Used with the `set_key` callback in struct ieee80211_ops, this indicates whether a key is being removed or added.

struct ieee80211_key_conf

Name

`struct ieee80211_key_conf` — key information

Synopsis

```
struct ieee80211_key_conf {
  enum ieee80211_key_alg alg;
  u8 hw_key_idx;
  u8 flags;
  s8 keyidx;
  u8 keylen;
  u8 key[0];
};
```

Members

alg

The key algorithm.

hw_key_idx

To be set by the driver, this is the key index the driver wants to be given when a frame is transmitted and needs to be encrypted in hardware.

flags

key flags, see enum ieee80211_key_flags.

keyidx

the key index (0-3)

keylen

key material length

key[0]

key material. For ALG_TKIP the key is encoded as a 256-bit (32 byte)

Description

This key information is given by mac80211 to the driver by the `set_key` callback in struct ieee80211_ops.

data block

- Temporal Encryption Key (128 bits) - Temporal Authenticator Tx MIC Key (64 bits) - Temporal Authenticator Rx MIC Key (64 bits)

enum ieee80211_key_alg

LINUX

Kernel Hackers ManualJanuary 2010

Name

`enum ieee80211_key_alg` — key algorithm

Synopsis

```
enum ieee80211_key_alg {
  ALG_WEP,
  ALG_TKIP,
  ALG_CCMP
};
```

Constants

ALG_WEP

   WEP40 or WEP104

ALG_TKIP

   TKIP

ALG_CCMP

    CCMP (AES)

enum ieee80211_key_flags

Name

`enum ieee80211_key_flags` — key flags

Synopsis

```
enum ieee80211_key_flags {
  IEEE80211_KEY_FLAG_WMM_STA,
  IEEE80211_KEY_FLAG_GENERATE_IV,
  IEEE80211_KEY_FLAG_GENERATE_MMIC,
  IEEE80211_KEY_FLAG_PAIRWISE
};
```

Constants

IEEE80211_KEY_FLAG_WMM_STA

    Set by mac80211, this flag indicates that the STA this key will be used with could be using QoS.

IEEE80211_KEY_FLAG_GENERATE_IV

    This flag should be set by the driver to indicate that it requires IV generation for this particular key.

IEEE80211_KEY_FLAG_GENERATE_MMIC

    This flag should be set by the driver for a TKIP key if it requires Michael MIC generation in software.

IEEE80211_KEY_FLAG_PAIRWISE

Set by mac80211, this flag indicates that the key is pairwise rather then a shared key.

Description

These flags are used for communication about keys between the driver and mac80211, with the `flags` parameter of struct ieee80211_key_conf.

Chapter 7. Multiple queues and QoS support

TBD

struct ieee80211_tx_queue_params

Name

struct ieee80211_tx_queue_params — transmit queue configuration

Synopsis

```
struct ieee80211_tx_queue_params {
  u16 txop;
  u16 cw_min;
  u16 cw_max;
  u8 aifs;
};
```

Members

txop

maximum burst time in units of 32 usecs, 0 meaning disabled

cw_min

minimum contention window [a value of the form 2^n-1 in the range 1..32767]

cw_max

maximum contention window [like *cw_min*]

aifs

> arbitration interface space [0..255]

Description

The information provided in this structure is required for QoS transmit queue configuration. Cf. IEEE 802.11 7.3.2.29.

Chapter 8. Access point mode support

TBD

Some parts of the if_conf should be discussed here instead

Insert notes about VLAN interfaces with hw crypto here or in the hw crypto chapter.

ieee80211_get_buffered_bc

Name

`ieee80211_get_buffered_bc` — accessing buffered broadcast and multicast frames

Synopsis

```
struct sk_buff * ieee80211_get_buffered_bc (struct
ieee80211_hw * hw, struct ieee80211_vif * vif);
```

Arguments

`hw`

>   pointer as obtained from `ieee80211_alloc_hw`.

`vif`

>   struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

Description

Function for accessing buffered broadcast and multicast frames. If hardware/firmware does not implement buffering of broadcast/multicast frames when power saving is used, 802.11 code buffers them in the host memory. The low-level driver uses this function to fetch next buffered frame. In most cases, this is used when generating beacon frame. This function returns a pointer to the next buffered skb or NULL if no more buffered frames are available.

Note

buffered frames are returned only after DTIM beacon frame was generated with `ieee80211_beacon_get` and the low-level driver must thus call `ieee80211_beacon_get` first. `ieee80211_get_buffered_bc` returns NULL if the previous generated beacon was not DTIM, so the low-level driver does not need to check for DTIM beacons separately and should be able to use common code for all beacons.

ieee80211_beacon_get

Name

`ieee80211_beacon_get` — beacon generation function

Synopsis

```
struct sk_buff * ieee80211_beacon_get (struct ieee80211_hw *
hw, struct ieee80211_vif * vif);
```

Arguments

hw

> pointer obtained from `ieee80211_alloc_hw`.

vif

> struct ieee80211_vif pointer from struct ieee80211_if_init_conf.

Description

If the beacon frames are generated by the host system (i.e., not in hardware/firmware), the low-level driver uses this function to receive the next beacon frame from the 802.11 code. The low-level is responsible for calling this function before beacon data is needed (e.g., based on hardware interrupt). Returned skb is used only once and low-level driver is responsible of freeing it.

Chapter 9. Supporting multiple virtual interfaces

TBD

Note: WDS with identical MAC address should almost always be OK

Insert notes about having multiple virtual interfaces with different MAC addresses here, note which configurations are supported by mac80211, add notes about supporting hw crypto with it.

Chapter 10. Hardware scan offload

TBD

ieee80211_scan_completed

Name

`ieee80211_scan_completed` — completed hardware scan

Synopsis

```
void ieee80211_scan_completed (struct ieee80211_hw * hw);
```

Arguments

hw

> the hardware that finished the scan

Description

When hardware scan offload is used (i.e. the `hw_scan` callback is assigned) this function needs to be called by the driver to notify mac80211 that the scan finished.

III. Rate control interface

Table of Contents

TBD

This part of the book describes the rate control algorithm interface and how it relates to mac80211 and drivers.

Chapter 11. dummy chapter

TBD

Chapter 11. dummy chapter

IV. Internals

Table of Contents

TBD

This part of the book describes mac80211 internals.

Chapter 12. Key handling

12.1. Key handling basics

Key handling in mac80211 is done based on per-interface (sub_if_data) keys and per-station keys. Since each station belongs to an interface, each station key also belongs to that interface.

Hardware acceleration is done on a best-effort basis, for each key that is eligible the hardware is asked to enable that key but if it cannot do that they key is simply kept for software encryption. There is currently no way of knowing this except by looking into debugfs.

All key operations are protected internally so you can call them at any time.

Within mac80211, key references are, just as STA structure references, protected by RCU. Note, however, that some things are unprotected, namely the key->sta dereferences within the hardware acceleration functions. This means that `sta_info_destroy` must flush the key todo list.

All the direct key list manipulation functions must not sleep because they can operate on STA info structs that are protected by RCU.

12.2. MORE TBD

TBD

Chapter 13. Receive processing

TBD

Chapter 14. Transmit processing

TBD

Chapter 15. Station info handling

15.1. Programming information

struct sta_info

Name

struct sta_info — STA information

Synopsis

```
struct sta_info {
  struct list_head list;
  struct sta_info * hnext;
  struct ieee80211_local * local;
  struct ieee80211_sub_if_data * sdata;
  struct ieee80211_key * key;
  struct rate_control_ref * rate_ctrl;
  void * rate_ctrl_priv;
  spinlock_t lock;
  spinlock_t flaglock;
  struct ieee80211_ht_info ht_info;
  u64 supp_rates[IEEE80211_NUM_BANDS];
  u8 addr[ETH_ALEN];
  u16 aid;

#endif
};
```

Members

list

    global linked list entry

hnext

    hash table linked list pointer

local

    pointer to the global information

sdata

    TBD

key

    TBD

rate_ctrl

    TBD

rate_ctrl_priv

    TBD

lock

    used for locking all fields that require locking, see comments in the header file.

flaglock

    spinlock for flags accesses

ht_info

    HT capabilities of this STA

supp_rates[IEEE80211_NUM_BANDS]

    Bitmap of supported rates (per band)

addr[ETH_ALEN]

    MAC address of this STA

aid

> STA's unique AID (1..2007, 0 = not assigned yet), only used in AP (and IBSS?) mode

listen_interval

> TBD

pin_status

> TBD

flags

> STA flags, see enum ieee80211_sta_info_flags

ps_tx_buf

> buffer of frames to transmit to this station when it leaves power saving state

tx_filtered

> buffer of frames we already tried to transmit but were filtered by hardware due to STA having entered power saving state

rx_packets

> Number of MSDUs received from this STA

rx_bytes

> Number of bytes received from this STA

wep_weak_iv_count

> TBD

last_rx

> TBD

num_duplicates

> number of duplicate frames received from this STA

rx_fragments

> number of received MPDUs

rx_dropped

> number of dropped MPDUs from this STA

last_signal

signal of last received frame from this STA

last_qual

qual of last received frame from this STA

last_noise

noise of last received frame from this STA

last_seq_ctrl[NUM_RX_DATA_QUEUES]

last received seq/frag number from this STA (per RX queue)

wme_rx_queue[NUM_RX_DATA_QUEUES]

TBD

tx_filtered_count

TBD

tx_retry_failed

TBD

tx_retry_count

TBD

tx_num_consecutive_failures

TBD

tx_num_mpdu_ok

TBD

tx_num_mpdu_fail

TBD

fail_avg

moving percentage of failed MSDUs

tx_packets

number of RX/TX MSDUs

tx_bytes

TBD

tx_fragments

> number of transmitted MPDUs

txrate_idx

> TBD

last_txrate_idx

> TBD

wme_tx_queue[NUM_RX_DATA_QUEUES]

> TBD

ampdu_mlme

> TBD

timer_to_tid[STA_TID_NUM]

> identity mapping to ID timers

tid_to_tx_q[STA_TID_NUM]

> map tid to tx queue

llid

> Local link ID

plid

> Peer link ID

reason

> Cancel reason on PLINK_HOLDING state

plink_retries

> Retries in establishment

ignore_plink_timer

> TBD

plink_state

> TBD

plink_timeout

> TBD

plink_timer

    TBD

debugfs

    debug filesystem info

Description

This structure collects information about a station that mac80211 is communicating with.

enum ieee80211_sta_info_flags

Name

`enum ieee80211_sta_info_flags` — Stations flags

Synopsis

```
enum ieee80211_sta_info_flags {
  WLAN_STA_AUTH,
  WLAN_STA_ASSOC,
  WLAN_STA_PS,
  WLAN_STA_AUTHORIZED,
  WLAN_STA_SHORT_PREAMBLE,
  WLAN_STA_ASSOC_AP,
  WLAN_STA_WME,
  WLAN_STA_WDS,
  WLAN_STA_PSPOLL,
  WLAN_STA_CLEAR_PS_FILT
};
```

Constants

WLAN_STA_AUTH

>   Station is authenticated.

WLAN_STA_ASSOC

>   Station is associated.

WLAN_STA_PS

>   Station is in power-save mode

WLAN_STA_AUTHORIZED

>   Station is authorized to send/receive traffic. This bit is always checked so
>   needs to be enabled for all stations when virtual port control is not in use.

WLAN_STA_SHORT_PREAMBLE

>   Station is capable of receiving short-preamble frames.

WLAN_STA_ASSOC_AP

>   We're associated to that station, it is an AP.

WLAN_STA_WME

>   Station is a QoS-STA.

WLAN_STA_WDS

>   Station is one of our WDS peers.

WLAN_STA_PSPOLL

>   Station has just PS-polled us.

WLAN_STA_CLEAR_PS_FILT

>   Clear PS filter in hardware (using the
>   IEEE80211_TX_CTL_CLEAR_PS_FILT control flag) when the next frame to
>   this station is transmitted.

Description

These flags are used with struct sta_info's `flags` member.

15.2. STA information lifetime rules

STA info structures (struct sta_info) are managed in a hash table for faster lookup and a list for iteration. They are managed using RCU, i.e. access to the list and hash table is protected by RCU.

Upon allocating a STA info structure with `sta_info_alloc`, the caller owns that structure. It must then either destroy it using `sta_info_destroy` (which is pretty useless) or insert it into the hash table using `sta_info_insert` which demotes the reference from ownership to a regular RCU-protected reference; if the function is called without protection by an RCU critical section the reference is instantly invalidated. Note that the caller may not do much with the STA info before inserting it, in particular, it may not start any mesh peer link management or add encryption keys.

When the insertion fails (`sta_info_insert`) returns non-zero), the structure will have been freed by `sta_info_insert`!

Because there are debugfs entries for each station, and adding those must be able to sleep, it is also possible to "pin" a station entry, that means it can be removed from the hash table but not be freed. See the comment in `__sta_info_unlink` for more information, this is an internal capability only.

In order to remove a STA info structure, the caller needs to first unlink it (`sta_info_unlink`) from the list and hash tables and then destroy it; `sta_info_destroy` will wait for an RCU grace period to elapse before actually freeing it. Due to the pinning and the possibility of multiple callers trying to remove the same STA info at the same time, `sta_info_unlink` can clear the STA info pointer it is passed to indicate that the STA info is owned by somebody else now.

If `sta_info_unlink` did not clear the pointer then the caller owns the STA info structure now and is responsible of destroying it with a call to `sta_info_destroy`.

In all other cases, there is no concept of ownership on a STA entry, each structure is owned by the global hash table/list until it is removed. All users of the structure need to be RCU protected so that the structure won't be freed before they are done using it.

Chapter 16. Synchronisation

TBD

Locking, lots of RCU
