

# IMPLEMENTERS

an old feature still evolving

context 2020 meeting

# Interfacing with Lua

- Quite some activity is delegated to Lua.
- Normally the initiative is at the T<sub>E</sub>X end.
- We can set variables or call functions etc.
- We can parameters to function calls.
- From the Lua end we can use scanners to pick up data.
- We provide some consistent interfaces for doing all that.
- From T<sub>E</sub>X to Lua we use `\ctxlua{...}` and friends.
- From Lua to T<sub>E</sub>X we use `context(...)` and alike.
- For adding functionality we use so called implementers.

# Calling Lua

```
1 \ctxlua{context("ok")}

ok

1 \ctxlua{context(2 * tokens.scanners.integer())} 10

20

1 \startluacode
2 function document.MyThing() context(2 * tokens.scanners.integer()) end
3 \stopluacode

1 \ctxlua{document.MyThing()} 20 \quad
2 \ctxlua{document.MyThing()} 30 \quad
3 \ctxlua{document.MyThing()} 40

40 60 80
```

# Streamlining Lua

```
1 \startluacode
2 interfaces.implement {
3     name      = "MyThing",
4     public    = true,
5     arguments = "integer",
6     actions   = function(i) context(i * 2) end,
7     -- actions = { function(i) return i * 2 end, context },
8 }
9 \stopluacode
10 \MyThing 20 \quad \MyThing 30 \quad \MyThing 40
11 40 60 80
```

# Making commands

```
1 \startluacode
2 interfaces.implement {
3     name      = "MyRoot",
4     public    = true,
5     actions   = function()
6         local a = tokens.scanners.integer()
7         if not tokens.scanners.keyword("of") then
8             -- tex.error("the keyword 'of' expected")
9         end
10        local b = tokens.scanners.integer()
11        context("%0.6N",math.sqrt(b,a))
12    end,
13 }
14 \stopluacode
1 \MyRoot 2 of 40 \quad \MyRoot 3 60
6.324555 7.745967
```

# Scanners

There are lots of scanners:

```
argument argumentasis array boolean box bracketed bracketedasis cardinal char
cmdchr cmdchrexpanded code conditional count csname delimited dimen dimension
float glue胶合 gluevalues hash hbox integer ischar key keyword keywordcs
letters list luocardinal luainteger luanumber lxmllid next nextexpanded number
optional peek peekchar peekexpanded real scanclose scanopen skip skipexpanded
string table token tokencode tokenlist tokens toks value vbox verbatim vtop
whd word
```

# A more complex example

Let's implement a matcher:

```
1 \doloopovermatch {(.)} {\luametatemplate} { [#1] }  
1 [l] [u] [a] [m] [e] [t] [a] [t] [e] [x]  
1 \doloopovermatch {[letterpercent w]+} {\cldloadfile{tufte.tex}} { [#1] }  
[We] [thrive] [in] [information] [thick] [worlds] [because] [of] [our] [marvelous] [and] [everyday]  
[capacity] [to] [select] [edit] [single] [out] [structure] [highlight] [group] [pair] [merge] [harmonize]  
[synthesize] [focus] [organize] [condense] [reduce] [boil] [down] [choose] [categorize] [catalog]  
[classify] [list] [abstract] [scan] [look] [into] [idealize] [isolate] [discriminate] [distinguish] [screen]  
[pigeonhole] [pick] [over] [sort] [integrate] [blend] [inspect] [filter] [lump] [skip] [smooth] [chunk]  
[average] [approximate] [cluster] [aggregate] [outline] [summarize] [itemize] [review] [dip] [into]  
[flip] [through] [browse] [glance] [into] [leaf] [through] [skim] [refine] [enumerate] [glean] [syn-  
opsisize] [winnow] [the] [wheat] [from] [the] [chaff] [and] [separate] [the] [sheep] [from] [the]  
[goats]
```

# A more complex example (T<sub>E</sub>X)

Here is the macro definition of this loop:

```
1 \protected\def\doloopovermatch#1#2#3%
2   {\pushmacro\matchloopcommand
3    \def\matchloopcommand##1##2##3##4##5##6##7##8##9{\#3}%
4    \ctxluamatch\matchloopcommand{\#1}{\#2}%
5    \popmacro\matchloopcommand}
```

- The pushing and popping makes it possible to nest this macro.
- The definition of the internal match macro permits argument references.

# A more complex example (Lua)

At the Lua end we use an implementer:

```
1 local escape = function(s) return "\\" .. string.byte(s) end
2
3 interfaces.implement {
4     name      = "ctxluamatch",
5     public    = true,
6     usage     = "value",
7     actions   = function()
8         local command = context[tokens.scanners.csname()]
9         local pattern = string.gsub(tokens.scanners.string(),"\\.",escape)
10        local input   = string.gsub(tokens.scanners.string(),"\\.",escape)
11        for a, b, c, d, e, f, g, h, i in string.gmatch(input,pattern) do
12            command(a, b or "", c or "", d or "", e or "", f or "", g or "",
13                  h or "", i or "")
14        end
15        return tokens.values.none
16    end,
17 }
```

So what does the `usage` key tells the implementer?

# Value functions

Normally we pipe back verbose strings that are interpreted as if they were files. Value functions are different;

- The return value indicates what gets fed back in the input.
- This can be: none, integer, cardinal, dimension, skip, boolean, float, node, direct.
- When possible an efficient token is injected.
- Value function can check if they are supposed to feed back a value.
- So, they can be used as setters and getters.
- A variant is a function that is seen as conditional.
- In (simple) tracing they are presented as primitives.
- They are protected against user overload (aka: frozen).
- All this is experimental and might evolve.

# So

Say that we want an expandable command:

```
1 \edef\foo{\doloopovermatched{.}{123}{#1}} \meaning\foo  
macro:->(1)(2)(3)
```

Or nested:

```
1 \edef\foo {  
2   \doloopovermatched {(..)} {123456} {  
3     \doloopovermatched {(.)(.)} {#1} {  
4       [#1][#2]  
5     }%  
6   }%  
7 } \meaning\foo  
macro:->[1][2][3][4][5][6]
```

# So

Compare:

```
1 \protected\def\doloopovermatch#1#2#3%
2   {\pushmacro\matchloopcommand
3     \def\matchloopcommand##1##2##3##4##5##6##7##8##9 {##3}%
4     \ctxluamatch\matchloopcommand{#1}{#2}%
5     \popmacro\matchloopcommand}
```

With:

```
1 \def\doloopovermatched#1#2#3%
2   {\beginlocalcontrol
3     \pushmacro\matchloopcommand
4     \def\matchloopcommand##1##2##3##4##5##6##7##8##9 {##3}%
5   \endlocalcontrol
6   \the\ctxluamatch\matchloopcommand{#1}{#2}%
7   \beginlocalcontrol
8     \popmacro\matchloopcommand
9   \endlocalcontrol}
```

Local control hides the assignments (it basically nests the mail loop).

# A few teasers (T<sub>E</sub>X)

```
1 \doloopovermatch {(\letterpercent d+)} {this 1 is 22 a 333 test} { [#1] }

2 \doloopovermatch {(\letterpercent w+) *(\letterpercent w*)} {aa bb cc dd} {
3   [
4     \doloopovermatch{(\letterpercent w)(\letterpercent w)} {#1} {##1 ##2}
5     \doloopovermatch{(\letterpercent w)(\letterpercent w)} {#2} {##1 ##2}
6   ]
7 }

8 \doloopovermatch
9   {(-)\letterpercent{\bf (-)\letterpercent}{.*}}
10  {this is {\bf a} test}
11  {#1{\it not }#2#3}
```

# A few teasers (Lua)

```
1  interfaces.implement {
2      name = "bitwisexor", public = true, usage = "value", actions =
3      function(what)
4          local a = tokens.scanners.cardinal()
5          scankeyword("with")
6          local b = tokens.scanners.cardinal()
7          if what == "value" then
8              return tokens.values.cardinal, a ~ b
9          else
10             logs.texerrormessage("you can't use \\bitwiseor this way")
11         end
12     end
13   }
14   interfaces.implement {
15       name = "ifbitwiseand", public = true, usage = "condition", actions =
16       function(what)
17           local a = tokens.scanners.cardinal()
18           local b = tokens.scanners.cardinal()
19           return tokens.values.boolean, (a & b) ~= 0
20       end
21   }
```

# Questions and more examples

More examples will be given in the editor.
